

Bluegiga Case Study

PHONIRO

Phoniro's innovative wireless lock system

Phoniro AB is a Swedish company established in 2004. They produce cost efficient and simple radio and information technology that enhances performance and quality assurance within the home care.

Typically, dealing with keys is troublesome and time consuming. Phoniro has come up with a simple and safe solution for this problem, a digital key for opening doors. The installation and execution is easy, since it doesn't require any cables. With the battery functional lock system, you can do ten visits per day up to twelve months. Phoniro Lock System uses *Bluetooth* wireless technology with WT12-A-AI module from Bluegiga Technologies. You use a cell phone to open the door by simply typing your password on your phone. The password also acts as a digital identification card, so that if your cell phone is stolen, the thief cannot enter your house. This new wireless lock system saves time up to 60 minutes per day within the home care segment and has quality assurance, since all visits at the care taker are recorded. In addition it is also climate friendly, because it decreases driving up to 15 percent.
